Annotated Bibliography

National Aeronautics and Space Administration. (n.d.). *Historical sounds*. NASA.
<https://www.nasa.gov/historical-sounds/>

This page served as the primary content source for the project. All ten audio recordings used in NASA.SAY were retrieved from this NASA archive, which collects historically significant transmissions from American space missions. The recordings include communications from Apollo 11, Apollo 13, Mercury, and Space Shuttle missions, selected for their cultural relevance and public accessibility.

Karavá, M. (2022). *Spiral galaxy with GUI* [Interactive web project]. Made in Webflow.
<https://webflow.com/made-in-webflow/website/spiral-galaxy-with-gui>

This interactive Three.js project provided visual and technical inspiration for the particle system implemented in NASA.SAY. The spiral galaxy effect, built with a WebGL point cloud and a graphical user interface for real-time parameter control, informed the design of the GRAPHICS panel, which allows users to adjust opacity, speed, size, count, spread, and color of the three-dimensional particle field that reacts to the audio volume.
